

AECB
the sustainable building association

2011 Annual Conference

**Retrofit: Moving
in and Moving on**

16-17 September 2011

Jubilee Campus, University of Nottingham

Organised by:

AECB
the sustainable building association

In association with:

The University of
Nottingham

Department of Architecture
and Built Environment

Evolved design; Is there a low energy building style?

AECB Conference 2011
Nottingham University
Nick Grant

The UK Passive House Organisation

AECB

Is there a style in the
natural world?

(Will we ever find a mouse with wheels??)

"an ineradicable fondness for beetles"

J. B. S. Haldane

Windows®. Life without Walls™. Dell recommends Windows 7.

If you can imagine it, you can create it.

Set your imagination free – and bring your most amazing ideas to life – with Dell Precision™ certified workstations.

Constraints

Physics:

- Size
- Heat loss area
- Linear thermal bridge length
- Thickness and continuity of insulation
- Glazing area
- Material properties
- Useful functional area and volume
- Climate
- Resources
- Sinks
- etc

Practicalities:

- Budget
- Available materials
- Planning
- Structural penetrations
- Given site
- Views to North?
- Noisy road to South?
- etc

Ski slope in the desert

**‘I don’t remember being forced
to accept compromises, but I’ve
willingly accepted constraints.’**

Charles Eames

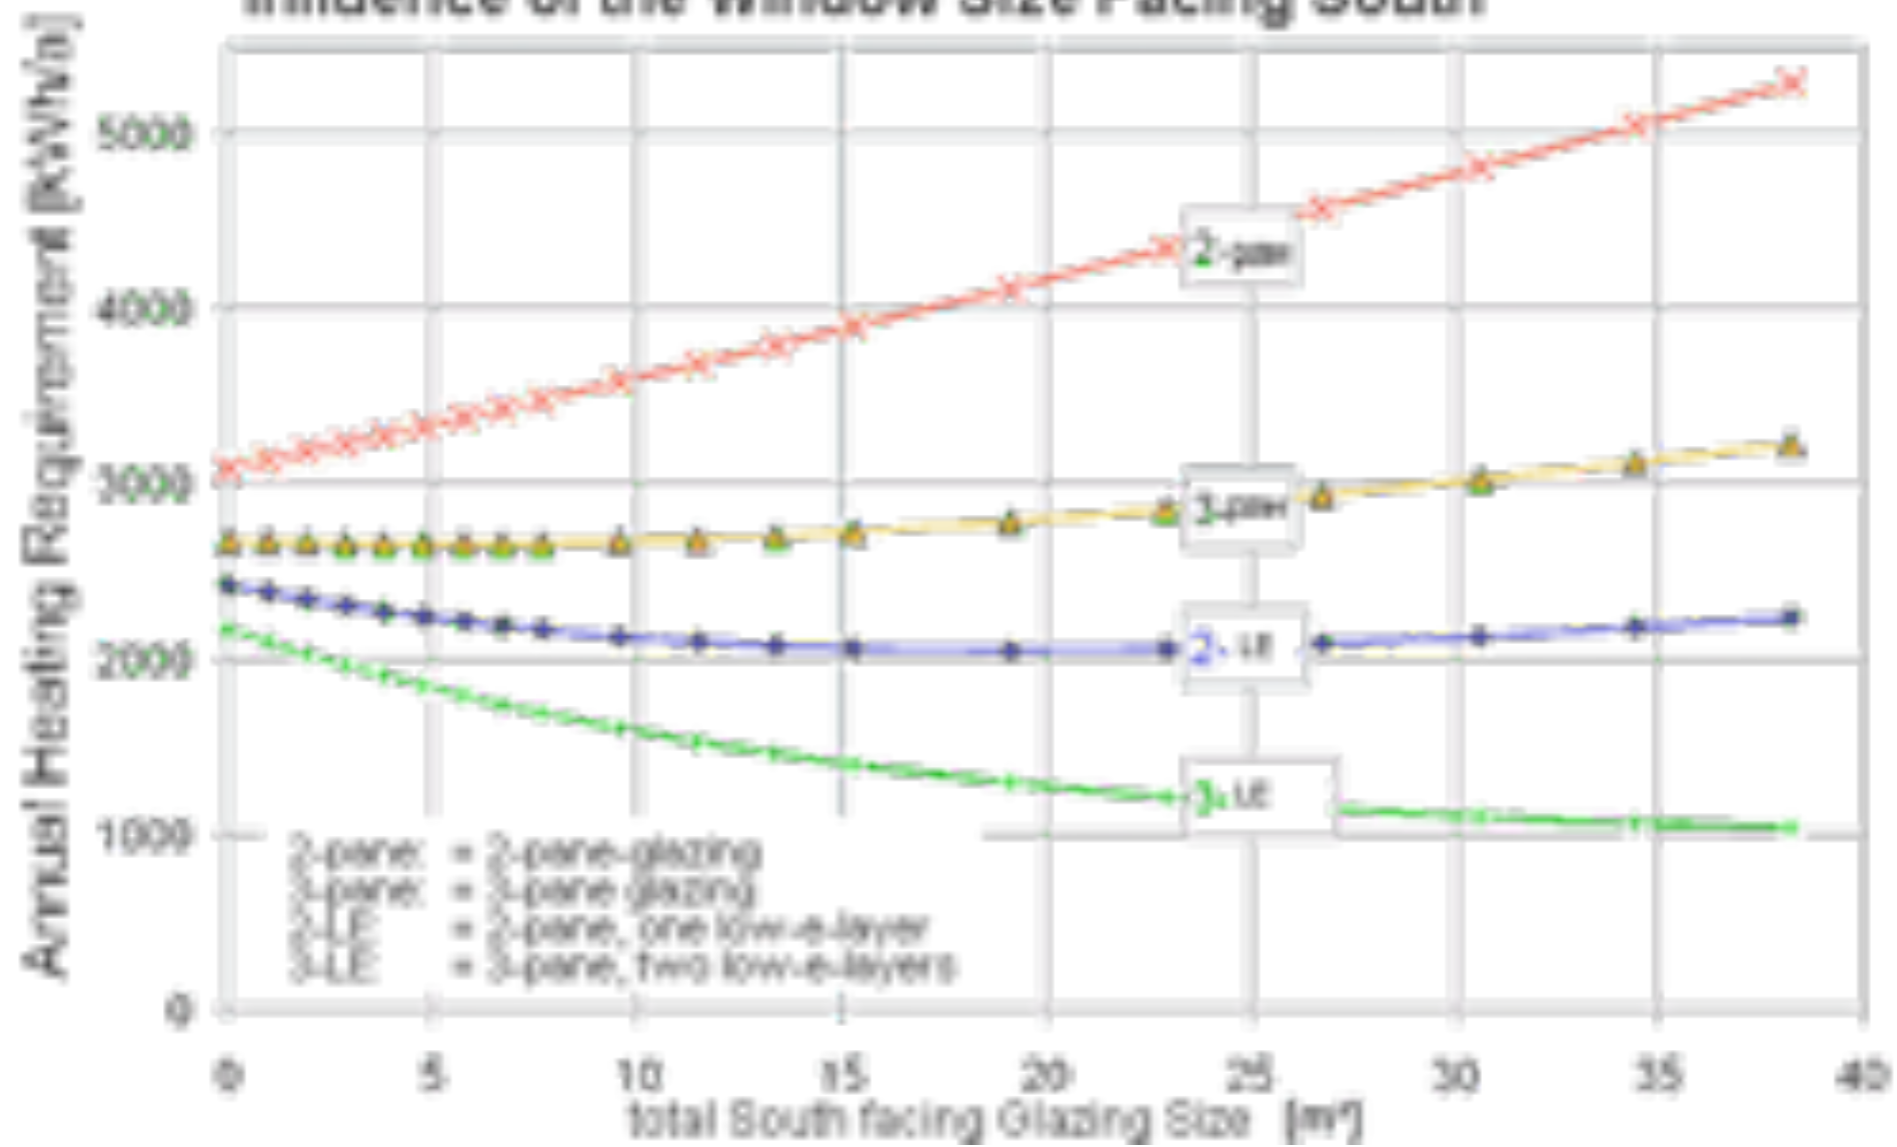

Solar vs Insulation

Passive solar style

Influence of the Window Size Facing South

The First Passivhaus

1991

Massing

Parametric PHPP model

Simplified model Alan Clarke & Nick Grant
CE - Manchester

Monthly Method	14.9 kWh/(m ² .a)	N. heavy
Frequency of Overheating	0.0 %	2
Daily temp swing	1.9 K	
No. houses in terrace	1.0	
deviation from due South	0.0 deg	
roof insulation pitch	0.0 deg	
Ceiling height	2.4 m	
No. Floors	2.0	
Depth (E-W) internal	7.0 m	internal width 10.7
Building length (internal)	16.7 m	glazed area as % facade number
N windows as % facade area	6%	3% 5% 3.2
E windows as % facade area	0%	0% 0% 0.0
S windows as % facade area	30%	21% 30% 10.7
W windows as % facade area	0%	0% 0% 0.0
Skylight m ² /house	0	0.0 0.0
Roof U-value	0.10	
Wall U-value	0.15	
Floor U-value	0.15	
Doors per dwelling	1.00	opaque 0.80 U
Gross internal floor area	150.0	each
less % =TFA	135	10%
Roof-ground floor thickness	0.4	
approx wall thickness	0.4	
party wall thickness	0.3	
Floor-ceiling thickness	0.2	
HRV efficiency	80%	
n50	0.4	
Additional shading fact	1.00%	
South overhang depth	0.3 m	
Reveal depths	0.15	all glazing
Total glazing area	15.4 m², is...	11% of floor area
ext A/int V	0.79

PHPP Energy balance

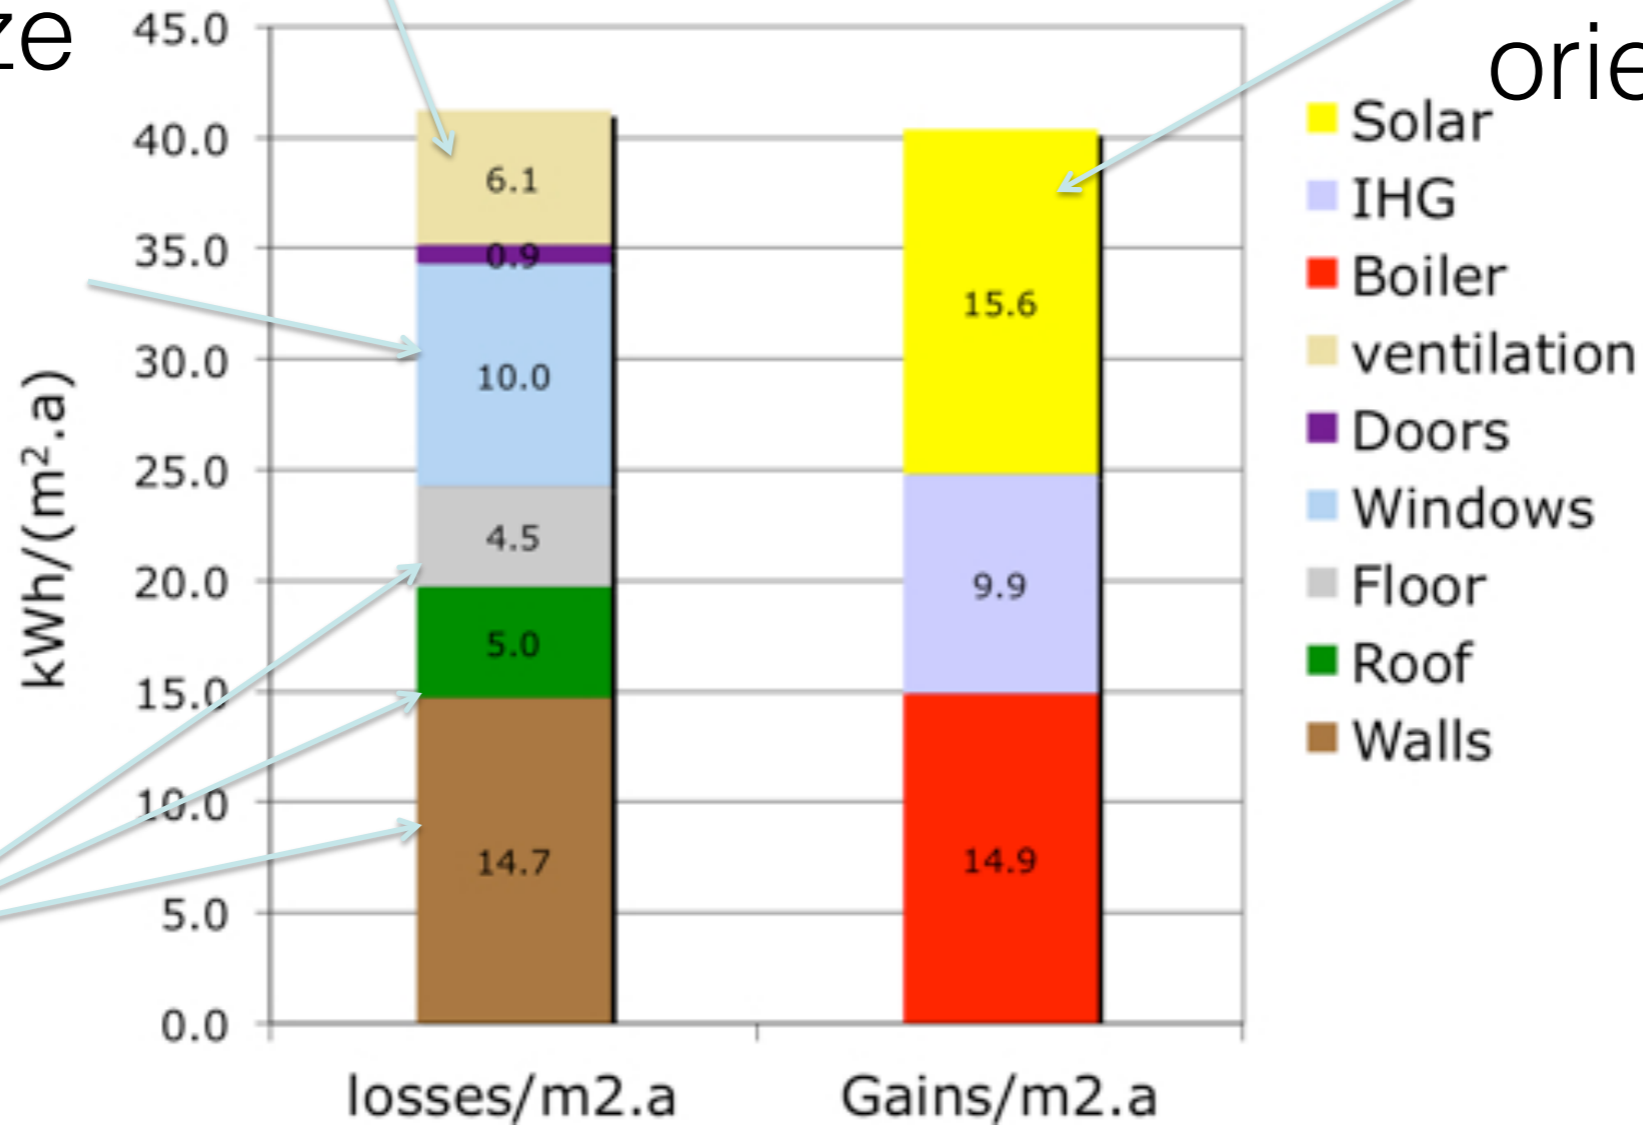

volume, occupancy

window size
& shape

form

Heat balance

shading,
orientation

100m² Detached

20kWh/(m².a) – not PH
= 2,000 kWh/a = £200 @10p/kWh

Size matters:

150m² with same spec' = 15kWh/(m².a)
= 2,250 kWh/a = £225 @10p/kWh

2 x 100m² Semi Detached

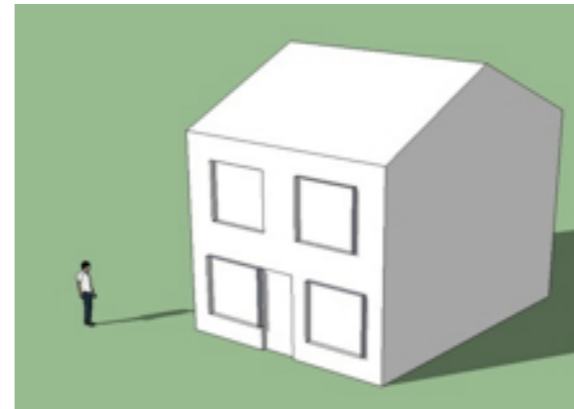

$$A/V = 0.74$$

$$A/TFA = 2.8$$

14.4 kWh/(m².a)

£140/year heat

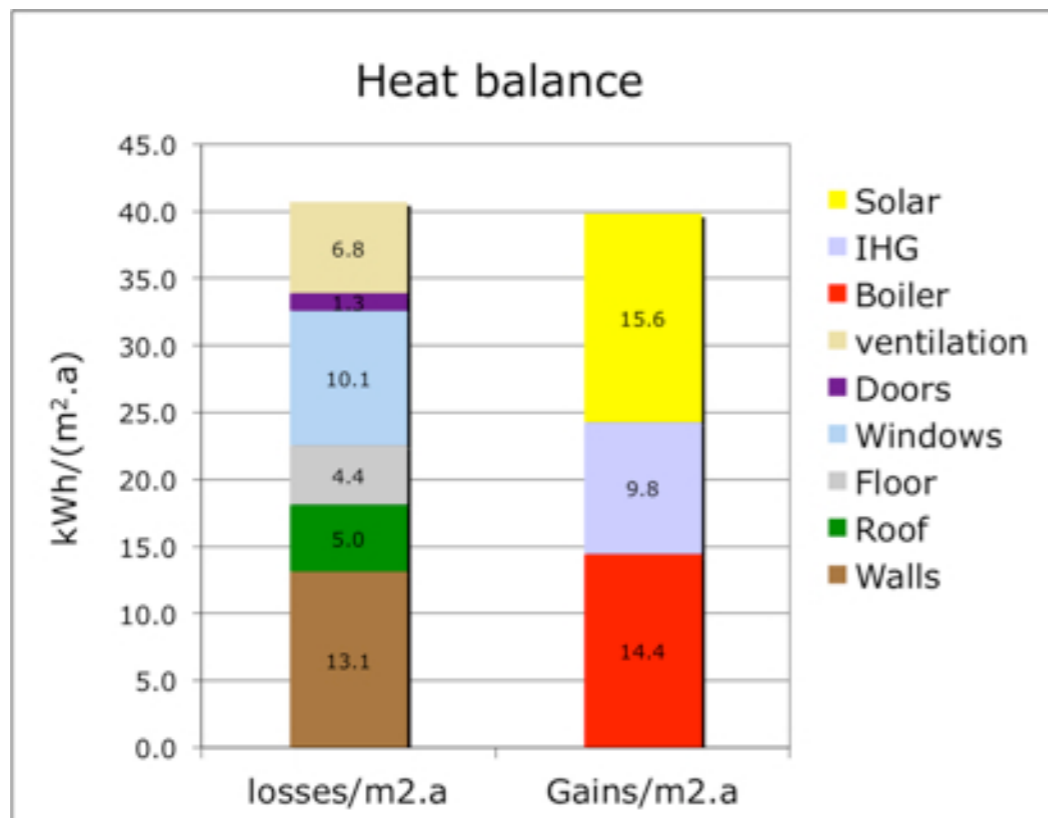

$$A/V = 0.87$$

$$A/TFA = 3.3$$

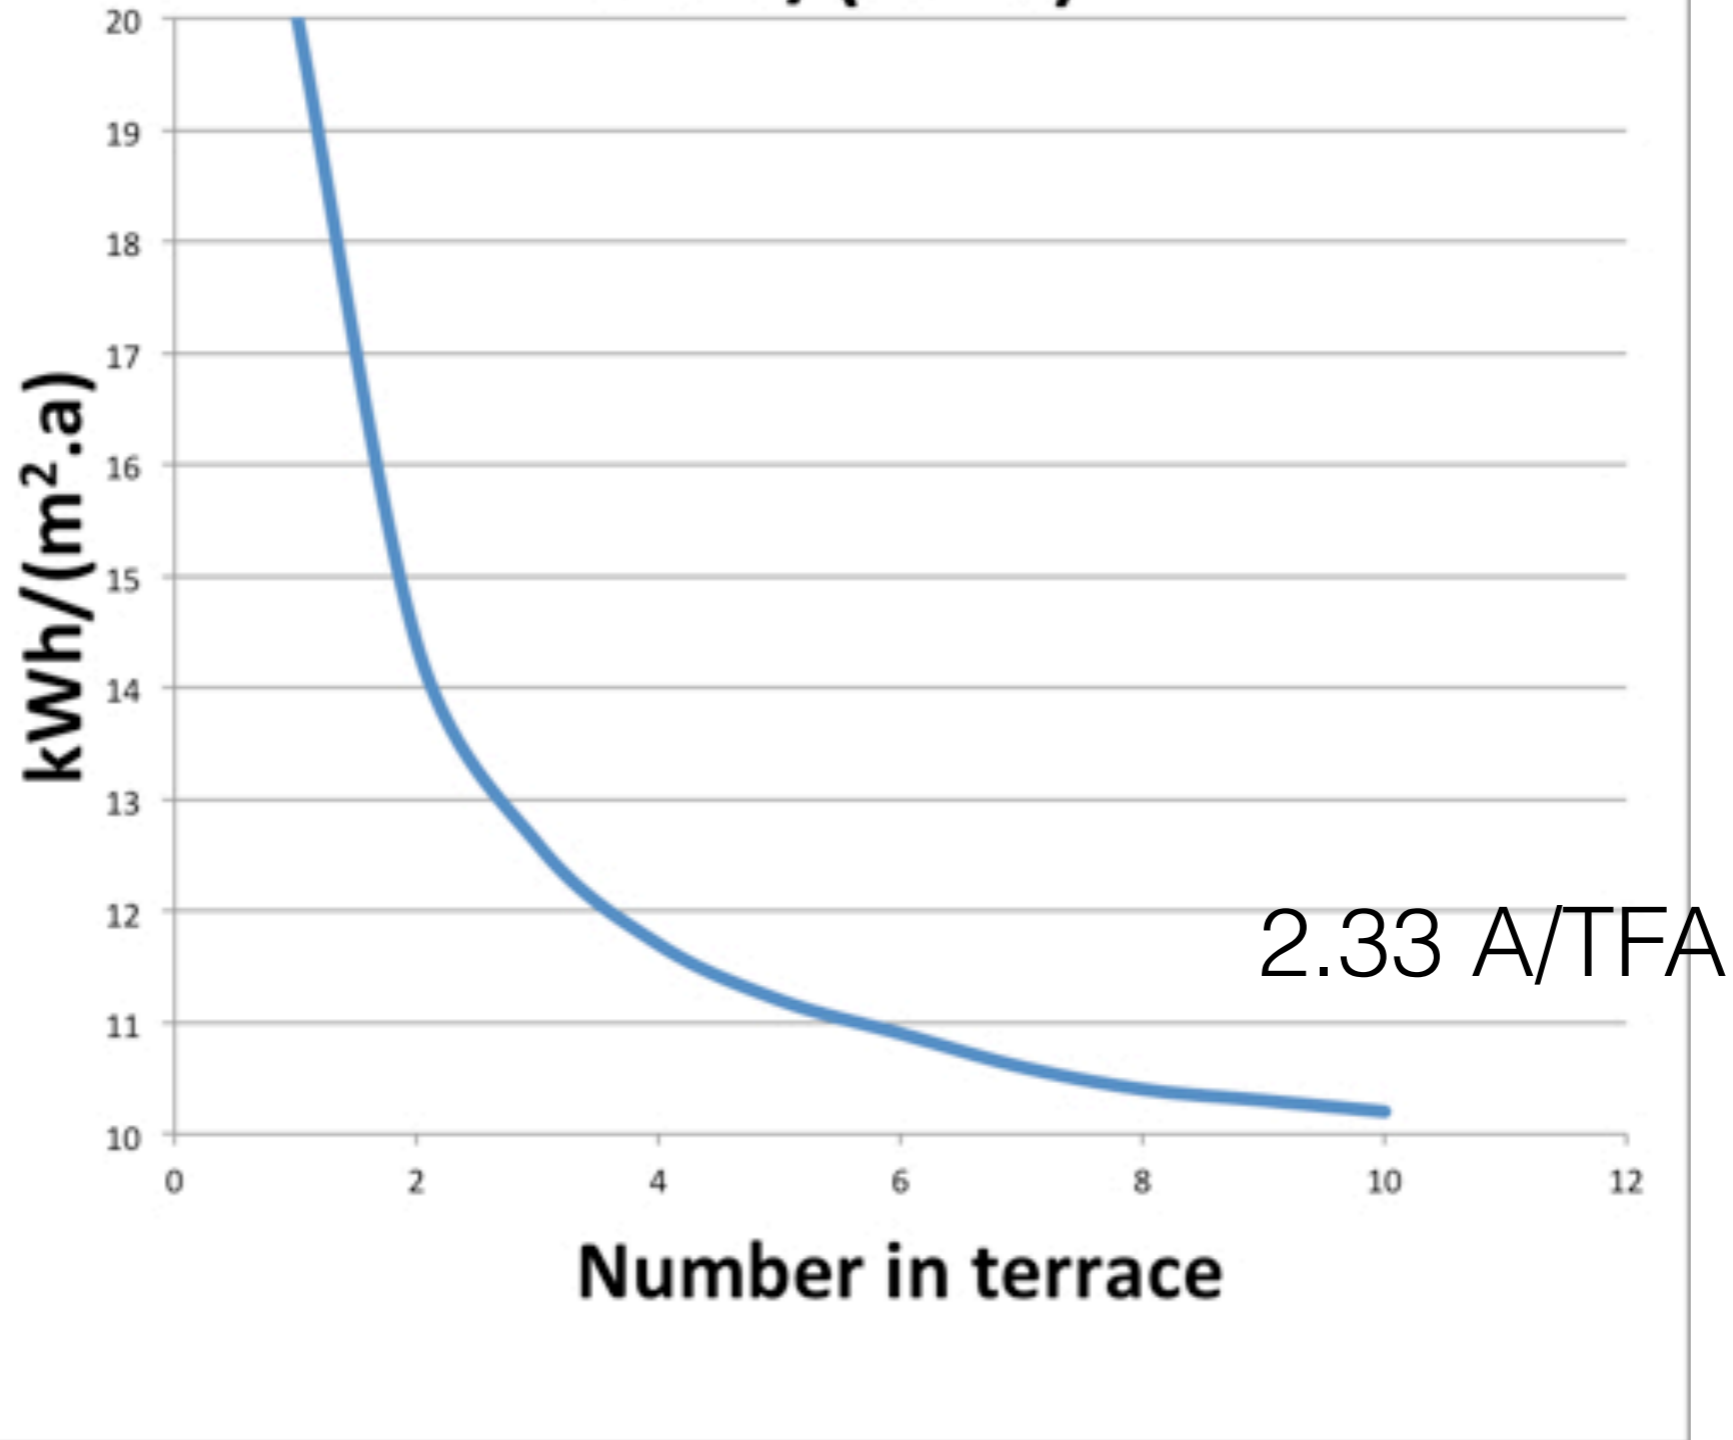

20.1 kWh/(m².a)

£200/year heat

3.34 A/TFA

kWh/(m².a)

2.33 A/TFA

Less energy or same energy for much less capital cost
Compound benefit – less heat loss area is less area to build

Lancaster Co-Housing

Passivhaus, simple compact form

Shape & complexity

Increased complexity means:

- Increased heat loss area for less useful floor area
- Shading of windows by building
- Thermal bridges – physical and geometric
- Tricky airtightness
- Increased cost
- Slower build
- More effort needed on finishes.

Parapets – cooling fins!

Heat flux Ψ_{ext} 0.12 W/mK

Fixed but is it safe?
use expensive connectors?

Spandrel panels.

(worked example from AECB Carbonlite Course)

The heat loss of glazing - without the light or solar gains.

Say 10m² of spandrel on 150m² building in Manchester

U wall 0.1, U spandrel 0.8 so $\Delta U = 0.7\text{W/m}^2.\text{K}$

10m² x 0.7W/m².K x say 70 kKh = 490 kWh/y extra heat

= another 3.3kWh/m².a

Energy costly features

- Bricks hung from structure
- Long vent ducts
- Long hot water circuits
- Cantilevered balconies
- Bin stores indented into envelope
- Shaded glass etc etc

As in nature:

- Layers:
 - structure
 - air barrier
 - insulation
 - wind and weather
 - external structure
- no penetrations
they leak!

Old barn but good airtightness strategy and good result

Thermal bridge free foundation

The First (of 3) UK Passivhaus Schools

Oakmeadow Primary Wolverhampton, Architype

Outmoded constraints

For UK Building Regulations, the performance of these two windows can be considered the same:

But with Passivhaus, you have to calculate them individually

Poor Installation;
Traditional mullions

Installation free of thermal bridges;
Simplified design

$$U_{\text{window}} = 1.8 \text{ W/m}^2\text{K}$$

$$U_{\text{window}} = 0.8 \text{ W/m}^2\text{K}$$

How could you optimise the window performance through design?

New thinking

Embrace constraints!

- Less options means less design time!
- Integrity of form and function
- Cost saving
- Often leads to great design
- Boring? Zen?

58

Conclusions

- Can't cheat physics
- Keep the envelope simple
- Keep the windows simple
- Embrace constraints such as simple form and no structural penetrations
- Help define a genuine green building pattern
- Keep irony outside the thermal envelope.
